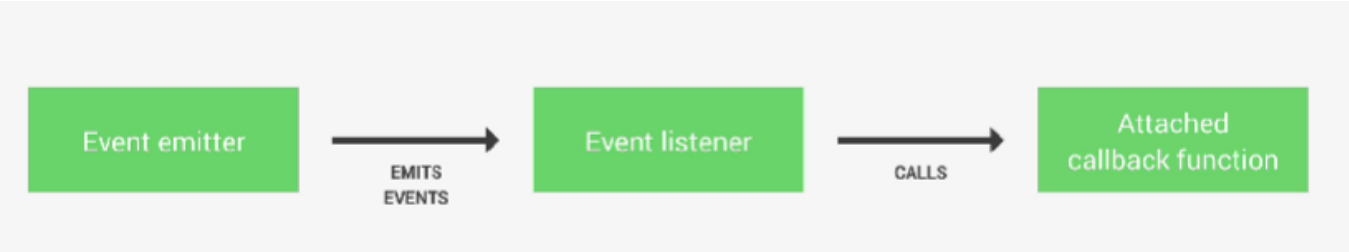
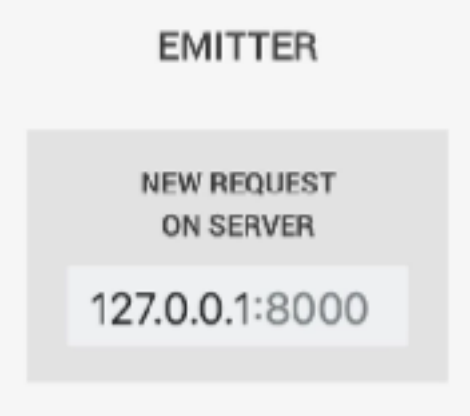
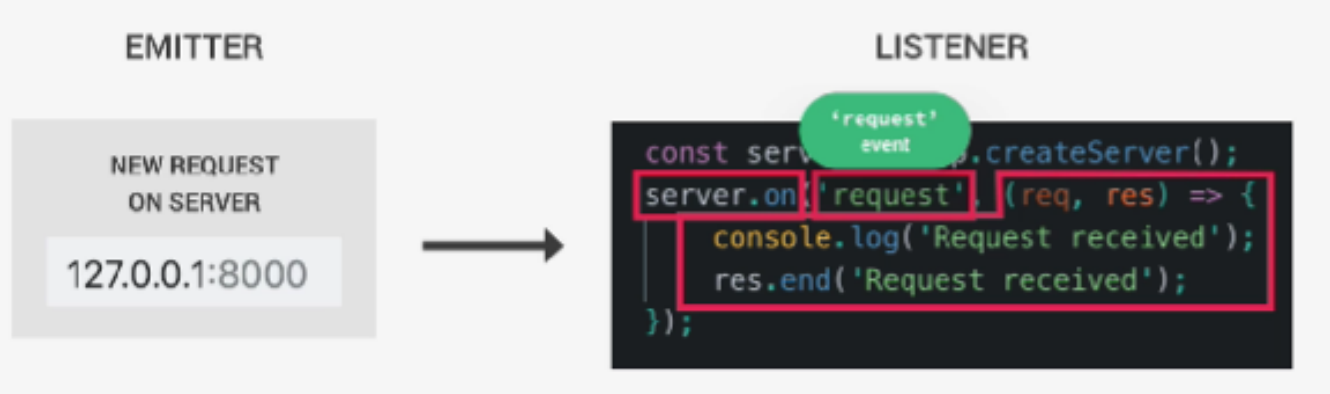
5. Revised - Events & Event-driven Architecture

Saturday, May 25, 2024 6:37 PM





```
const server = http.createServer();
server.on('request', (req, res) => {
    console.log('Request received');
    res.end('Request received');
});
```



a function calling another function

A method that listens to Events, trigger callbacks (req, res) => {...}

Everything is more de-coupled as callbacks are more Reactive rather than Called

Each module can have its own Event Listeners => more de-coupled

Event-driven Architecture makes it way more straightforward to react multiple times to the same Event
